

## Changes

1. Both the input path s should be as input command ( just like how the Hostname username )
2. Timestamp in the LogFile.
3. Yellow color text while the PC is shutting down ( on the terminal just like the Green text you used ) This is the first and later pop-up window.
4. A pop-up when when the PC is shutting down ( Saying the PC is shutting down then it should shutdown the PC )
5. Do not use the SSH logic ( we need to use the Pinging the Gateway of the local internet ) ( as soon as the PC gets in the range of the WIFI then it should automatically start to push the files to another PC. ( **VERY IMPORTANT** )
6. Hostname , User and other details should be hard coded.

The Logic is there if that there 2 PC as **A** and **B**

Here A and B are two separate PC

On **A** PC we will run the code and it should send the files to **B** PC and later the PC **A** should shutdown once the transfer is done.
